Project Proposal (Proposed Solution) report

The proposal is to provide an AI-enabled backend API for fitness-related application needs. The source configuration supports API access, JWT authentication, MongoDB data storage, and Gemini AI integration.

Project Overview

Objective – The objective is to provide a backend API that supports secure client access, persistent data storage, and AI-assisted functionality using the configured Gemini model.

Scope – The supported scope includes the API backend, JWT-based authentication, MongoDB integration, and Gemini AI integration. Detailed frontend and fitness workflows are not specified in the source.

Problem Statement

Description – The project requires a backend service that can handle client/API requests, authenticate users securely, store application data, and connect to an AI model.

Impact – The configured backend components provide a foundation for secure API access, persistent storage, and AI-assisted processing. Specific measured impact is not provided by the source configuration.

Proposed Solution

Approach – Implementing an API backend with JWT authentication, MongoDB for data persistence, and Gemini AI integration using the configured model.

Key Features – Backend/API service running on port 5000; JWT-based authentication; MongoDB database integration; Gemini AI integration using the configured Gemini model. The source configuration does not specify real-time decision rules or continuous learning.

Resource Requirements

Hardware – Computing/GPU, RAM, and storage specifications are not specified in the source configuration.

Software – Gemini AI integration is specified; other frameworks, libraries, and development environments are not specified.

Data – MongoDB is specified for data storage; database schema, size, and file format are not specified.
